PROFILE

A final year Informatics Engineering student with a strong practical focus on self hosted software and infrastructure development. Experienced in building end to end projects that include modern frontend frameworks, scalable backend architectures, and AI powered computer vision systems. Able to manage containerized environments and implement zero-trust infrastructure. Highly adept at leveraging AI assisted workflows to accelerate development velocity while maintaining structural and code integrity.

EDUCATION

Institut Teknologi dan Bisnis Bina Sarana Global (Global Institute)

Undergraduate Informatics Engineering | 2022 - Expected 2026

PROJECT EXPERIENCE

Self Hosted Home Server Infrastructure

Tech Stack: Docker, Ansible, Cloudflare Tunnel, Prometheus, Linux

- Designed and engineered a highly resilient, containerized infrastructure environment to self-host multiple personal and production applications.
- Enforced strict zero trust internet exposure by routing external traffic securely through Cloudflare Tunnels and managing internal nodes with Tailscale.
- Automated end to end server provisioning, multi service deployment, and configuration management using Ansible playbooks.
- Deployed active monitoring, metric collection, and alerting pipelines utilizing Prometheus and Grafana to ensure high availability and performance tracking.

Face Recognition Attendance System

Tech Stack: Python, OpenCV, Flask, LBPH, Haar Cascade

- Built and optimized an AI powered facial attendance system designed to fully automate and modernize traditional manual check in processes.

- Implemented real time face detection using Haar Cascade and high accuracy identification utilizing LBPH algorithms.
- Developed robust Flask API services to handle seamless attendance processing, backend administration, and data logging.
- Reduced attendance logging time by approximately 90% while successfully mitigating proxy attendance and buddy punching incidents.

Digital Invitation SaaS Platform

Tech Stack: Next.js, PostgreSQL, TypeScript, Tailwind CSS

- Architected a multi tenant SaaS platform enabling seamless generation of custom digital wedding invitation websites.
- Designed and deployed a dynamic custom domain routing layer alongside an integrated, real-time RSVP management system.
- Empowered non-technical users to independently deploy personalized, production-ready invitation websites within minutes.

UMKM Mapping & Promotion Platform

Tech Stack: Flutter, Firebase, Mapcn API, Dart

- Developed a high performance, cross platform mobile application aimed at digitalizing and mapping local MSMEs (UMKM).
- Integrated advanced geospatial mapping features and real time location tracing using the Mapcn API.
- Utilized Firebase for real-time content management, secure user authentication, and cloud data synchronization.

TECHNICAL SKILLS

- Frontend: Flutter, Next.js, React.js, TypeScript, JavaScript, Tailwind CSS.
- Backend: Laravel, Node.js, REST API Development, Flask, Firebase Functions
- Database: PostgreSQL, MySQL, Firebase Firestore, Supabase
- Infrastructure & DevOps: Docker, Linux Server Administration, Nginx Proxy Manager, Cloudflare Tunnels, Tailscale, Ansible, Prometheus, Grafana, CI/CD Deployment
- AI & Computer Vision: Python, OpenCV, Haar Cascade, LBPH Face Recognition
- AI-Assisted Workflow: Claude, Cursor AI
